The Reference for Stunning™

Optically coated curved as well as irregular shaped surfaces

We've coated undulating formed acrylic waterfalls backlit by LED. We have coated spheres, hemispheres and toroidal rigid shapes. We have a long list of happy customers who see the difference in our work and experience tremendous value in the optical properties and visual aesthetics that only Stewart can provide.

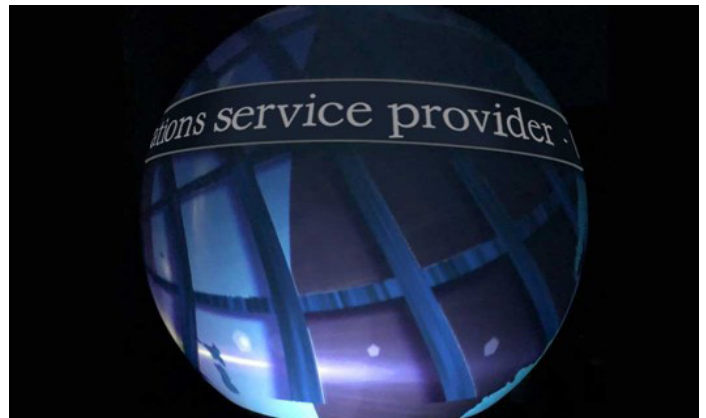

Excellent color fidelity and quality imaging

Just because your shape is challenging doesn't mean you need to accept an inferior, hot-spotting, hot mess of a coating. We maintain the highest possible standards in providing optical surfaces that will give you infinitely better images.

We embrace challenges

Rear projection screen material can be custom laminated to your specialty shape. We can also flow coat it, and if necessary, we will hand-spray it. There is always a way to get an image working on a given surface. We know how.

Stewart Filmscreen comprises a can-do team of highly experienced professionals who relish the challenges of your engineered substrates and prototypes. We are the first choice of many of the world's leading aerospace and aeronautical companies for simulation and specialty projects. We'll work with you to bring the extra dimension that you need and the visual acuity that you require.
